Chapter 2. Making Shapes

“What’s that mean, Making Shapes?” asked Morf.

“It means that it’s time to take all that you learned about moving Ernestine around the screen and putting it to good use!” responded Logy. “We’re going to start with simple shapes to make sure everyone knows what they are. Then we’ll move on to some fancier stuff.”

“Ok, how do we start?”

Exploring Shapes

Let’s play turtle. That’s what I do best.

You can use your Pencil Turtle, you can use yourself, or you can use some of your friends. In fact, why not try all three?

Rabbit Trail 6. Body Geometry

Can you use your fingers to make a shape that looks like a square? It’s not too easy, is it.

So try this one.

Get with a friend. Hold your arms out. Can you make a better square now?
Making Shapes

Get a bunch of friends together and make a big circle. Now make a very small circle.

What do you have to do to make a triangle? Can you make a triangle by yourself? Or do you need some friends to help you out?

Playing turtle gives you an idea of just what it takes to make different shapes.

Exploring Squares

Let’s start with an easy shape, like a square.

Do you know what makes a square different from, say, a triangle? Or a rectangle? Well, for one thing, all the sides of a square are the same size.

Tell the turtle to go HOME — not on the computer — you’re still doing Body Geometry, remember? Pretend that HOME is in the middle of the room or the middle of your paper.

Now, what commands must you give the turtle to walk through a square?
1. FORWARD _______ TURTLE STEPS
   Are you going to make a BIG square or a little square?

2. RIGHT _______ TURTLE TURNS
   You can turn left if you want. But how many turns do you have to make? 30? 67? 105? 298?

   We’ve already done this. It was when we were talking about turtle turns. If you forget, why not turn back to Chapter 1 and find it again?

3. FORWARD _______ TURTLE STEPS
   Fill in the blank with the same number of steps that you did in step 1.

4. RIGHT _______ TURTLE TURNS
   How many turns should you make here? Should this be the same number of turns as you made in step 2?

5. FORWARD _______ TURTLE STEPS
You should already know how many steps to go this time.

6. RIGHT ______ TURTLE TURNS

How many turtle turns this time?

7. FORWARD ______ TURTLE STEPS

8. RIGHT ______ TURTLE TURNS

What did you discover about a square?

Sure, the four sides have to be the same. But what about the corners? Do they have to be the same? Why?

That’s simple!

If they’re not the same, you’ll end up going off in some strange direction and never make it back HOME.

Let’s try this on the computer.

Get Logo up and running. Then type these commands.

FD ______ RT ______ FD ______ RT ______

FD ______ RT ______ FD ______ RT ______

Wow! All the sides and all the corners have to be the same. But that’s a lot of typing when you do that three or four times. There has to be an easier way!
Repeating Commands

Look at all those commands. Do you see what you did? You repeated the commands FD ______ and RT ______ four times. So let’s try a new command.

Here’s what it looks like in Logo.

REPEAT 4 [FD 100 RT 90]

This tells the turtle to REPEAT the commands that are inside the brackets four times. Brackets look like square parentheses — [ ]. They hold lists of numbers, words, and things. More about these later on.

First, let’s try some other squares. You fill in the steps. The number of turns has to be 90, right?

REPEAT 4 [FD ______ RT 90]

Make a great big square!

REPEAT 4 [FD ______ RT 90]

Make a little bitty square!
Morf tried the number 7 but decided that was a bit too itty-bitty. What are you going to use?

REPEAT 4 [FD ______ RT 90]

How about joining some squares together? Maybe you can think up a nice pattern using squares.

Terrific! Now for a tough one. Put a square inside a square?

That means you have to draw a big square, pick the pen up, move inside the big square, and draw a little square.

Whoops, one of the steps has been left out. Think about it. Which one is it?

Let’s see. Draw a big square. Pick the pen up. Move inside the big square and draw a little square. You can’t draw another square until you put the pen back down, right?

OK, no more tricks. Put the pen down and then draw a little square.

Don’t forget. When you start exploring squares and things, it’s good to write your great ideas on paper or in your journal. Then you can use the same ideas again later.
More Adventures with Squares

There are lots of things you can do with squares.

Draw a little square first and then draw a big square around the outside. Draw a big square and then put a little square in the corner.

Draw a big square and then stack some other squares on top of it, like stacking up boxes.

What else can you do with boxes?

Take a look at the pictures below and on the next page. Can you make them?

How about some stairs?
What’s the same about these pictures? What’s different?
What other things can you make?
How about flags?
Don’t forget to write down your ideas. You may just want to use some of these ideas later on.
Rabbit Trail 7. Logo Puzzles

Here’s a puzzle for you. Look at this picture.

It looks like four squares hooked together, doesn’t it.

Get some straws or some sticks and make this puzzle on a table top. Now, take away just one straw or stick so that there are only three squares left.

Can you do that?

You can also try solving the puzzle by drawing it on paper or on the computer. Later, after you learn about writing procedures, we’ll show you how to have the turtle solve the puzzle for you.

Saving Your Work

After you have spent a lot of time creating some nice pictures, you might want to save your work. However, you can only do that when you write procedures. These are lists of commands that Ernestine remembers. You’ll learn more about writing procedures in the next chapter.

For now, use your journal to save what you do.
Exploring Triangles

Now, are you ready to tackle a triangle? What makes a triangle different from a square?

That’s right, a triangle has three sides and three corners. A square has four of each — four equal sides and four equal corners or angles.

Adventures With Angles

There’s a new word for you. Angles! Is that something like a corner?

Draw a line. Make a turtle turn of any size and draw another line.

Just like magic, there’s an angle between the lines, right? But what about on the outside? Is that an angle, too?

Sure it is. It’s just a big angle. Wow! That’s a lot of turtle turns!
Morf still likes to call them turtle turns. But they’re really angles. And while Morf measures angles in degrees, some people measure angles in “degrees.” More about degrees later.

Now, what about a triangle? Do all the sides and corners have to be the same or can they be different?

If you said the sides and the corners can be different, give yourself a big Gold Star! But there’s a funny thing about triangles. If all the sides are the same, can the angles be different?

Give yourself another Gold Star if you said, No!

But how do you know? If all the sides are the same, why do the angles have to be the same? Let’s explore some triangles and see if we can figure this out.

Get Logo up and running. Let’s start where we left off with the squares.

FD 100

RT 90

FD 100
OK! Now you have two sides and one angle on the screen. That angle has a special name. It’s called a **Right Angle**.

“I know,” Morf chimed in. “That’s because the turtle goes to the right!”

“No, I’m afraid not, Morf. They call it a right angle because it has 90 degrees. You can also make a right angle by turning left. I know that sounds crazy. Just trust me.”

When you talk about degrees, you use that little ° symbol. As we said, you’ll hear more about angles and degrees later. For now, let’s get back to triangles.”

A triangle has three sides and three angles. So, let’s make the corner into a triangle.

The easy way is to just type HOME.
There’s a triangle, three sides and three angles.

We know for a fact that two of the sides are equal. You typed FD 100 two times, right?

Look at the angle down near HOME. Compare that with the one in the upper right corner.

Do they look to be the same? Are they the same as the corner you made when you went RT 90? Let’s see.

With the turtle at HOME, type

RT 90 FD 100

Hey! That looks like three sides of a square. What commands do you need to finish the square? RIGHT 90 sends you in the wrong direction. So why not try

LT 90 FD 100

Now you should be at the upper right corner of a square that is also two triangles, correct? OK, now type HOME.

Look at the angles at HOME. Compare them with the angles in the upper right corner of the square. Do all four of the angles look the same?

You’re right. They are the same. Let’s check this out.
Check It Out

Type CS to clear the screen and take the turtle HOME. Then type

REPEAT 4 [FD 100 RT 90] to draw a square.

Now turn RIGHT 45 and go FD 200. What happened? The turtle drew a line right through the upper right corner. Now type HOME and then type

REPEAT 2 [FD 100 RT 90]

This takes you to the upper right corner of the square with the turtle facing the bottom of the screen.

Turn RIGHT 45 and go FD 200 again, just as you did before. What happened?

The same thing, right? Only this time the turtle drew a line through the lower left corner.

Do you think we can make a rule from all this?

A Rule for Triangles

It looks like it. It seems that when a triangle has two equal sides, you’re going to have two equal corners or angles.

In the example above, you turned RT 45 twice, correct?
Just to make sure, let’s try another triangle. Clear the screen. Then try this

FD 100 RT _______ FD 100 HOME

Add any number you want. Do you see two equal sides and two equal angles on the screen? Try it a few more times, just to be sure. Use lots of different numbers for the turtle turns.

FD 100 RT _______ FD 100 HOME

FD 100 RT _______ FD 100 HOME

FD 100 RT _______ FD 100 HOME

This idea seems to work, doesn’t it. Do you notice anything else about your triangles?

First you went FD 100. Then you turned right and went FD 100 again. When you turn, you create the angles A and B as shown in the drawing above. Then, after going FD 100 the second time, you went home, creating the C and D angles.

Now let’s try something else. Clear the screen and type

FD 100 RT 60 FD 100 HOME
Now you know that angle A is 60 degrees and angle B is 120 degrees, right? Why?

Now type

RT 60 / 2 FD 200

That’s RT 60 divided by 2, then FD 200.

WOW! The angles C and D are half the size of angle A. Why? Type

FD 100 RT ______ FD 100 (Fill in a number.)

Now type RT 180 - ______ Fill in the number of turns you just made when you turned right. What happened? Is the turtle facing the bottom of the screen?

 Hmmmmm! This is getting interesting. Now type

RT ______ / 2 FD 200

Fill in the number of turns you made above and divide it by two and then go FD 200. What happened?

DOUBLE WOW! You’re discovering all sorts of things about triangles!

Take another look at the triangle drawing on the last page, the one with angles A, B, C, and D. What do you know now?

Angles A + B = 180
Angles C + D = Angle A
Angle C = Angle D
If all this is true, then

\[
\text{Angles B + C + D = 180}
\]

So, the sum of all the angles in a triangle equals 180. But before we look at more rules, try this one

\[
\text{FD 100 RT 120 FD 100 HOME}
\]

Do you see anything different about this triangle? Let’s check this out. Type

\[
\text{RT 60 FD 100}
\]

What happened? Where’s the turtle? All three sides are equal now, aren’t they? And if the sides are equal, what about the angles?

Well, that’s easy to check, too! All you have to do is use the REPEAT command to draw three sides and three corners.

\[
\text{REPEAT 3 [FORWARD 100 RIGHT 120]}
\]

Wow! It works! And just to be completely certain, let’s go back to the triangle with two equal sides. Clear the screen and type

\[
\text{FD 100 RT 90 FD 100 HOME}
\]

Now let’s check that last line. Turn RIGHT 45 and go FORWARD 100. Did this take you back to the other corner?
More Rules for Triangles

No, not quite. However, it looks like you proved something about triangles.

1. If you have three equal sides, you’ll have three equal angles.
2. If you have two equal sides, you’ll have two equal angles.
3. If you have no equal sides, none of the angles will be equal.
4. The sum of the three angles in a triangle equals 180 degrees.

Looks like Logy got into a bit of trouble exploring triangles. How about you?
Can you make an hourglass?

Looks like a bowtie!

A fancy bowtie!
Morf wanted to go find another caterpillar.

Can you draw another caterpillar for Morf?
Look what that caterpillar changed into. Why not draw a big butterfly?
Rabbit Trail 8. More Triangle Puzzles

Here are some more Logo puzzles to do using a pencil and paper.

Draw each of these figures without retracing any line, and without lifting your pencil from the paper. Later on, you’ll find Logo procedures that will solve the puzzles for you.
Adventures With Rectangles

Speaking of rules, what about squares and rectangles? We know a square has four equal sides. And, we know the four angles are all 90 degrees.

What makes a square different from a rectangle? Or is it different? They’re both boxes, some have square sides and some have rectangles for sides. I’m confused!

“To start, let's draw rectangles. You fill in the blanks.

Rectangle #1       Rectangle #2

FD _____          FD _____
RT _____          RT _____
FD _____          FD _____
RT _____          RT _____
FD _____          FD _____
Making Shapes

RT ______   RT ______

FD ______   FD ______

RT ______   RT ______

What rules did you discover when trying to draw a rectangle?

Can you draw a rectangle where all four sides are different lengths? Not very easily, right? Wonder what that shape would be?

Can you draw a rectangle with only two equal sides? The other two would be unequal? No, that doesn't work either.

What about this blackboard? Is it a rectangle?

Can you draw a rectangle that has two sets of equal sides, where two sides are say, 100 steps long and two other sides are 200 steps long?

Yes! That's something you can do!
What does all this tell you about rectangles? If a square is a rectangle, then you’re going to have four right angles. Right angles have to be 90 turtle turns, or 90 degrees.

Now, go ahead. Try stacking up some rectangle boxes.

REPEAT 2 [FD _____ RT 90 FD _____ RT 90]
REPEAT 2 [FD _____ RT 90 FD _____ RT 90]
REPEAT 2 [FD _____ RT 90 FD _____ RT 90]
REPEAT 2 [FD _____ RT 90 FD _____ RT 90]
REPEAT 2 [FD _____ RT 90 FD _____ RT 90]
REPEAT 2 [FD _____ RT 90 FD _____ RT 90]

What happens when you make the number of turtle steps the same for both blanks? You got it! That’s a square!
Making Shapes

Rules for Rectangles

So, I guess you can make some rules about rectangles and squares.

1. A rectangle has to have four equal angles and four sides.
2. A square is a rectangle with four equal sides and four equal angles.
3. A rectangle has two sets of equal sides.

One more thing, what’s the sum of the angles of a rectangle? Where have you seen that number before?

You’ll explore the Rule of 360 and lots of other shapes in the later chapters of this book. In the meantime, let’s get some practice using what you’re just learned.

From the Center

Here’s a challenge for you. Suppose you had to draw a rectangle around a spot somewhere on the screen. How would you do that?

The first thing you need to know is the size of the rectangle. Then you need to know where to put it.

• Draw a rectangle that is 50 turtle steps wide and 120 turtle steps high.
• Put the center of the rectangle 100 turtle steps from HOME and 100 turtle steps to the left.

Now let’s figure out how to do this.

The command to draw the rectangle looks easy enough. From the lower right corner of the rectangle, tell the turtle to

REPEAT 2 [FD 120 RT 90 FD 50 RT 90]

That will work, won’t it?
Next, finding the center of the rectangle seems easy enough, also. How about this:

```
PU HOME FD 100 LT 100
```

This is the center of the rectangle.

Looking at the picture should give you an idea for drawing the rectangle around that spot. Do you see how to do it?

Sure! You go FD half the width of the rectangle, turn RT 90, and then go FD half the length of the rectangle. Turn around and your set to draw. Remember to put the pen down first.

```
FD 50 / 2
RT 90
FD 120 / 2
RT 180
PD
```

Now draw your rectangle.

```
REPEAT 2 [FD 120 RT 90 FD 50 RT 90]
```

There you are, a rectangle drawn around a center spot somewhere on the screen. You’ll see more of this type of thing as you move through the book. Chapter 7, for example, shows you an easier way to draw shapes around a center spot.
Let’s Review

This is really like a test. It’s about stuff you’ve already done. We just want to see if you know where to find the answers if you need to.

Sometimes it is more important to know where to find answers than it is to know the answers.

Anyway, the reason we call this a Review is because when I mention the word “Test,” Morf runs off and hides.

A square has _____ sides and _____ angles, all of which are _____.

A triangle has _____ sides and _____ angles.

A rectangle has _____ sides and _____ angles, all of which are _____.

To make the corner of a square, you have to turn ______ turtle turns.

To make the corner of a triangle with equal sides, you make _____ turtle turns.

If you add up all the angles of a square, you get _____.

______ + ______ + ______ + ______ = ______
If you add the angles of a triangle, you get _____.

_____ + _____ + _____ = _____

If you add up all the angles of a rectangle, you get _____.
That’s just like a square and you’ve already done that, right?

Now, look at your answers. Do you see something strange here? Do you think that may be important? We’ll see later on. First, you’ve got lots more to do with the shapes you know.

________________________________________________

**Morf’s Oneliners**

OK, so this one isn’t really a Rabbit Trail. It’s all about having some fun with your new shape commands on the computer rather than off the computer.

Think about all the things you know how to do now. You can move Ernestine around the screen. You can draw squares, rectangles, and triangles using the REPEAT command. Why not put them all together in one Big, Fantastic, Gorgeous “oneliner.”

What’s a “oneliner?” Well, why not start with this one. It uses a square.

REPEAT 12 [REPEAT 4 [FD 100 RT 90] RT 30]

Add a stem and it looks like a flower, doesn’t it?
Making Shapes

REPEAT 6 [FD 100 REPEAT 6 [FD 10 BK 10 RT 60]~
  BK 100 RT 60]
REPEAT 6 [FD 100 REPEAT 60 [FD 20 BK 20 RT 6]~
  RT 60]

What do these look like?

SPECIAL NOTE: That strange symbol at the end of the lines shown above is a tilde (~). That tells MSW Logo that the line is continued below. For example:

REPEAT 12 [REPEAT 4 [FORWARD~
100 RT 90] RIGHT 30]

In this book, we also indent the second line so that it is easier to read.
All of these are nice shapes. But why not try some crazy shapes, just to discover what the turtle can do.

REPEAT 12 [FD _____ RT _____ BK ____ LT ____]

Why not see who can come up the prettiest or the fanciest “one-liner.”

Try It on Paper

Dreaming up one-liners can be tough sometimes. So why not try it on paper first?

Draw a design or a picture using just one shape. Earlier in this chapter, you saw a caterpillar made from squares. You also saw stacks of boxes, flowers, bowties, hourglasses, and other things made from just one shape.

What can you do with triangles or rectangles?

A young lady in the third grade drew a cat using just triangles. Then she drew it on the computer so she could print it to show to her family.

Think of what you can do with just one shape.
Rabbit Trail 9. Clocks, String, and Other Stuff

Do you need some help understanding angles, degrees, and things?

Well, here are some off-the-computer activities you can use to make some sense out of this. In these activities, you’ll be looking at angles, degrees, shapes, and planes — using clocks, string boards, balls of string, or colored yarn.

The Turtle’s Clock

Let’s start with a clock. If you can tell time, you can understand angles and degrees.

You’ll need some help from your friends or the others in your class. You’ll also need a large room or a big space outside. The last thing you’ll need is a long piece of string or rope at least as wide as your circle will be.

The first thing to do is draw a large chalk circle on the floor. Here’s an easy way to do it.

1. Have one person hold the string down on the floor in the center of the room.
2. Stretch the string out to where you want the edge of the circle to be.
3. At the edge of the circle, wrap the string around the chalk a few times.
4. With the chalk on the floor, keep the string tight and walk in a circle around the person in the middle. Make sure the middle person turns with you so the string doesn’t get wrapped around them.
5. When your circle is complete, stretch your string across the middle of the circle from top to bottom.

6. Mark the top and bottom positions on the circle as 12:00 o’clock and 6:00 o’clock.

7. Stretch the string across the middle of the circle from side to side. This should divide the circle into four equal parts. Mark the side positions as 3:00 o’clock to the right of 12:00 o’clock and 9:00 o’clock to the left.

8. With the string stretched across the center of the circle, mark off the positions for 1:00 o’clock and 7:00 o’clock, 2:00 o’clock and 8:00 o’clock, 4:00 o’clock and 10:00 o’clock, 5:00 o’clock and 11:00 o’clock.
Now you have a clock face on the floor.

If you’re at HOME facing 12:00 o’clock, what time will it be if you turn RIGHT 90°? It will be 3:00 o’clock, right?

If you turn RIGHT 90 again, what time is it? 6:00 o’clock, right?

Turn RIGHT 90 again and it’s 9:00 o’clock. Turn RIGHT 90 once more and you’re back at 12:00 o’clock again.

You turned RIGHT 90 four times for a total of 360° or 360 turtle turns.

There’s that number again, 360!

Standing at HOME and looking at 12:00 o’clock, turn to 1:00 o’clock. If it’s 90 turns to 3:00 o’clock, how many is it to 1:00 o’clock? To 2:00 o’clock?

Turn back to 12:00 o’clock. How far will you have to turn to look at 6:00 o’clock?

How far is it if you turn right? If you turn left?

It’s the same, isn’t it. It’s 180 turns each way.
Let someone else have a turn playing turtle. If that person faces 6:00 o’clock and turns RIGHT 90, where are they facing? Remember the turtle turns from the direction she is facing, so it’s 9:00 o’clock.

Don’t play using just RIGHT or LEFT 90.

What’s the turn from 4:00 o’clock to 8:00 o’clock? From 1:00 o’clock to 10:00 o’clock? Try out all sorts of turns in both directions. Here’s your chance to get used to working with many different angles.

There’s a clock face with hands on the next page that you can use for practice. There’s also a file on your Discovery book diskette called CLOCK.PCX. Print it and then cut out the hands.

Use the clock with the hands that are included. Or use your pencil turtle or the walnut turtle described below.

Rabbit Trail 10. Clocks On and Off the Computer

Write the numbers 1 through 12 on small stickers. Start with the turtle at HOME and have one of your friends type FD 100 BK 100. Put the 12:00 o’clock sticker at the top of the first line. Have the next friend type RT 30 FD 100 BK 100. Put the 1:00 o’clock sticker at the end of this line. Continue like this all the way around the circle until you have all twelve numbers on the screen. Does this look like a clock?

Now you can play Simon Sez or Mother, May I on and off the computer using times instead of distances.

Simon Sez turn to 4:30 o’clock.
Simon Sez turn to 11:00 o’clock.
Turn to 9:00 o’clock.
Rabbit Trail 11. Learning With a Ball of String

You’re going to need a piece of wood from which you can cut a square that is about 12 inches on each side. Use a piece of shelf board or a piece of plywood.

You’re also going to need at least thirteen small nails about 1-1/2 inches long, a hammer, a pencil, and about 12 feet of yarn. String will do.

1. Hammer a nail into the center of the board, just part way so that you have an inch or more sticking up from the board.

2. Tie the string to the nail in the center. Now you’re going to make a circle around the center nail.

3. Stretch the string out to the edge of the board.

4. Put your pencil out near the edge of the board. (Hold it up straight.) Then wrap the string around the pencil.

5. Hold the pencil up straight and stretch the string out from the nail. Make sure you hold the string so that it doesn’t
come off the pencil. Then draw a circle around the center nail.

Now we're ready to hammer the other twelve nails into the board. But first, do you have a printer that can print pictures? If so, the turtle can make you a pattern for your string board.

Do you remember how to draw a triangle with three equal sides?

REPEAT 3 [FORWARD 100 RIGHT 120]

Now let's use that in a one-liner to make a pattern.

REPEAT 12 [REPEAT 3 [FORWARD 100 RIGHT 120]~ RIGHT 30]

Wow! There's a pattern with twelve points, just like the numbers on a clock. Print the screen.

Now carefully push the pattern over the nail in the center of the board. Hold or tape the pattern in place. Then draw a line along each of the pattern lines to the circle you drew before. Where each line crosses the circle, hammer in a nail.

Looks like a clock, doesn't it? Well, now you and the string can play turtle graphics.

Take the string from the center nail (that's HOME on the screen) and stretch it up to the nail at 12 o'clock.
Rockin’ Around the Clock

Go around the 12:00 o’clock nail and take the string around the 3:00 o’clock nail. Then take the string HOME.

Now do the same thing, only go around the 1:00 o’clock nail and the 4:00 o’clock nail.

What’s really going on here?

You’re moving a triangle through space, turning it on a vertical axis that passes through HOME. Can you think of a better way to demonstrate how things move through space?

“You’re moving around a what?”
Making Shapes

“The circle is on a vertical axis. Vertical means it goes up and down or top to bottom. It’s the opposite of horizontal, which means it’s lying flat or going from side to side.

“It looks something like this.”

The line is the center is the axis. As you draw triangles on the circle, it’s like they are moving through space on the circle. That’s the plane or surface.

But let’s not get too complicated. You’re supposed to be having fun, remember?

Yeah, but how do you draw a circle to look like that?

You’ll learn more about that in Chapter 8.

Now, go around the 2:00 o’clock nail and the 5:00 o’clock nail, the 3:00 o’clock nail and the 6:00 o’clock nail, the 4:00 o’clock nail and the 7:00 o’clock nail. Continue on all the way around.
What pattern has the string made? It looks just like the one you printed, doesn’t it. Only this one’s inside a circle.

Your hand acted like the turtle as it moved around the string board, didn’t it? But instead of drawing lines on the screen, you made a line of string.

Take a close look at this drawing. We’ve been talking about and using triangles to create this. But do you see some other shapes here? Do you see the squares? Can you find the one shown in the picture below?
How many squares can you find?

Now look carefully at the command that made the pattern.

REPEAT 12 [REPEAT 3 [FORWARD 100~
RIGHT 120] RIGHT 30]

Your first REPEAT 3 [FORWARD 100 RIGHT 120] went from HOME, around the 12:00 o’clock nail, around the 3:00 o’clock nail, and then HOME. Then did you turn RIGHT 30 turtle turns?

Guess so, right?

If you turn back to the beginning of this Rabbit Trail, you’ll find that you can do all the clock activities you did on the floor on your new string board.

How about doing your string board activities on the floor, too!

Rabbit Trail 12. The String Toss Game

This can be a great game with a group of friends. It gives you the chance to act out Logo commands by drawing with a ball of string or, better yet, a ball of colored yarn.
Have one person stand in the middle of your chalk circle. Then put other friends at each of the twelve points at the edge of the circle. You can also have one friend write down commands. Another can do the commands on the computer.

The person in the middle is like the turtle. The turtle always starts facing 12:00 o’clock.

LEFT 30

Toss the string to 11:00 o’clock, then to 1:00 o’clock. Then toss it HOME.

What shape is this?

Sure, it’s a triangle. See how this works? It’s even more fun when you make crazy shapes. Try it.

Finding Shapes All Over

One more thing!

Now that you’ve had some fun working with different shapes, why not go outside and see if you can find any of them in your neighborhood?

Look at your house. Can you find a rectangle there? A square? A triangle? Do you see any trees that look like circles? Triangles?
There are lots of basic shapes in nature and in the things we build. That’s why it’s important to know how to work with them.

Morf loves flowers.

REPEAT 30 [TRI 80 RT 12]
REPEAT 30 [TRI 40 RT 12]
END

How about a tree?
Why not draw some fancy ornaments? Print them out and then color them for a holiday.

Why not decorate your room?

There are all sorts of things you can do!

“But what about the other kinds of shapes?”

You really need to learn more about writing procedures first. You’ll see lots of different shapes in later chapters. In the meantime, you’ve got enough to enjoy for a while.

Have fun! In fact, have lots of fun!
